

KENDRION SOLUTIONS

Safe even in case of emergency

The perfect latch for turnstiles

In the field of access control, a high level of operational safety is imperative. Products of the highest quality that work precisely, reliably and safely are essential here.

In case of danger, turnstiles can be retracted with the help of the HD8 solenoid, thus ensuring a safe, fast opening of the passage. The HD8 also features an integrated maintenance-free armature bearing that achieves high reliability.

For the single passage control in the unit, another Kendrion solenoid is used to grant access to authorized persons and open the turnstile or remain in the locked position to deny access.

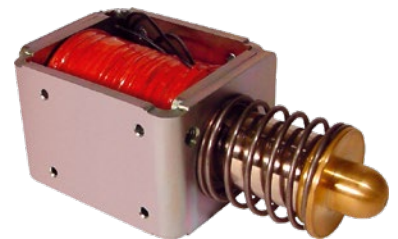

Kendrion is your partner with decades of technology and locking know-how.

Product features

- maintenance-free armature bearing (bush bearing)
- high actuating forces due to special yoke geometry
- robust design
- long service life

Other examples of use

- building services engineering
- industrial applications
